EMPLOYMENT

University of Southampton	September 2026
Research Fellow	
<i>The Ethics of Doubt</i>	
Genia Schönbaumsfeld (principal investigator)	

EDUCATION

Rutgers University	Expected October 2026
Ph.D. in Philosophy	(all requirements completed)
<i>Parsimony's Place in Philosophy</i>	
Juan Comesaña (co-chair), Ernest Sosa (co-chair), Jill North, and Matthew McGrath (external)	
Pomona College	2019
B.A. in Philosophy, <i>cum laude</i> , Phi Beta Kappa	

AREAS

Specialization: Epistemology, AI, social and political philosophy
Competence: metaphysics, philosophy of mind, philosophy of science

PUBLICATIONS († = invited; all others refereed)

Conspiracy Theories and the Hidden Evidence Penalty <i>Synthese</i>	Forthcoming
Parsimony and Overfitting <i>Philosophy of Science</i>	Forthcoming
Consciousness Multiplied <i>Philosophy and Phenomenological Research</i> , advance online publication	2026
Indoctrination and Democratic Legitimacy <i>Philosophy & Public Affairs</i> , advance online publication	2026
Reply to Bozenhard: Why Creators Cannot Win† <i>Philosophy & Technology</i> , 39, 109	2026
Skepticism and Ontological Parsimony <i>Pacific Philosophical Quarterly</i> , 107(2), 86-98	2026

Minorities and Philosophy

2020-2022

Co-coordinator, Rutgers University

DISSERTATION ABSTRACT

Empirical evidence underdetermines theory—doubly so in philosophy, where such evidence is marginal. To adjudicate between empirically adequate theories, we must turn to the non-empirical virtues, with parsimony chief among them. Yet parsimony's epistemic credentials are precarious: why think that simpler theories are more likely to be true? My dissertation aims to answer this question and clarify parsimony's role in epistemology more generally. Its first part concerns the epistemology of *undetectable* phenomena; its second part concerns parsimony more broadly.

I argue that we are justified in *prima facie* disbelieving theories that posit undetectable entities, with important implications for epistemology. Because the skeptic denies that our faculties can support justified beliefs about the external world, they deny the possibility of acquiring undefeated evidence that it exists. In other words, by their lights, the external world is undetectable. Thus, appropriately supplemented with an anti-undetectability principle, the skeptical challenge intensifies into something far more radical: outright *denial* that the external world or its constituents, as we commonly conceive of them, exist. This poses problems for concessive responses to skepticism, such as entitlement-based and pragmatic strategies.

The anti-undetectability principle can also be brought to bear on conspiracy theories. Because conspiracy theories posit secret activities, they necessarily postulate hidden, highly undetectable phenomena. If theories positing perfectly undetectable entities are to be *prima facie* disbelieved, then positing highly undetectable entities should likewise incur some lesser epistemic penalty. This allows us to explain what makes conspiracy theories intrinsically epistemically suspicious without unduly implying that belief in a conspiracy theory could never be justified.

The dissertation then turns to more general questions of parsimony, beyond undetectability. Many philosophers have attempted to defend parsimony's use in philosophy by analogy to science. Against this, I argue that whereas science invokes parsimony under conditions of noisy evidence, philosophers require a notion of parsimony that applies in the absence of significant noise. When the evidence is noisy, parsimony safeguards against overfitting. But because the philosophical data (e.g., intuitions about thought experiments) are characterized by predictable *bias* rather than noise, the overfitting-based justification cannot vindicate parsimony's use in philosophy.

To defend ontological parsimony's use in philosophy, I argue that it ranges over only our metaphysically fundamental commitments. While this position has become influential in recent years, the arguments for it have been largely suggestive. By contrast, I offer an entailment. The key observation: ontological and ideological commitments can be traded without loss of explanatory power. It follows that with respect to parsimony, they must be treated analogously. Since we already have reason to believe that ideological parsimony ranges over only primitive ideology, we must accept that ontological parsimony ranges over only fundamental ontology.

The possibility of exchanging ontological and ideological commitments also suggests that both forms of parsimony reduce to a single, more foundational virtue: brute fact parsimony. I conclude the dissertation by developing this reduction, with implications for the metaphysics of laws.
